

Chapter Summary — Relations and Functions

*(This document is a very rough summary of the the concepts and tasks that we covered in this chapter. The plan is to write a similar document at the end of each chapter, but time will tell.
I hope this document will be use to you when revising the chapter. However, please do not think that this comes with any guarantee of completeness — the probability of me overlooking something is large. Please ask if you think I have omitted anything.

Section A: Concepts

A.1: Relations

- Definition of relation based on subsets of a Cartesian product**
 - A relation is a set so properties/concepts of sets carry over to relations.
 - Terminology: source and target, and domain and image
- Properties of relations from set A to set B (i.e., relating to the output values)**
 - one to one (injective)
 - into vs onto (surjective)
 - bijective = injective + surjective
- Properties of relations on a set (source=target)**
 - Main three properties: reflexive, symmetric and transitive
 - anti-symmetric
 - iireflective and asymmetric
- Equivalence relation = reflexive, symmetric and transitive**
 - Decomposition of a set into equivalence classes.
- Representation of relations**
 - Set of ordered pairs
 - Venn diagrams — good for discrete (any usually finite) sets
 - Digraph — for relations on a set (source=target)

A.2: Functions

- Definition of function as a restricted relation — exactly one outgoing arrow for each element in the source**
 - A function is a relations so properties/concepts of relations carry over to functions.
 - Formal vs informal definition of functions
- Representation of functions (in addition to those for relations (above))**
 - Lookup table
 - Formula — good for continuous or infinite sets
 - 2D Cartesian Plots — good for continuous or infinite sets
- Algebra of functions**
 - Notation: addition/subtraction/multiplication/division of functions
 - Function composition
 - Repeated iteration of functions
- Function inverse**
 - bijective = necessary and sufficient condition for existence of inverse function pair.

Section B: Tasks

B.1: Relations

- Verify that a set is a relation from set A to set B .
- Represent a relation using suitable format (3 options)
- Verify that a relation has/does not have various properties

B.2: Functions

- Represent a function using suitable format (6 options)
- Verify that a function has/does not have various properties in particular injective, surjective and bijective
-
